Quadro Bonded Screens

Did you know that Quadro offers round hole screens as small as 0.006"?

Quadro has successfully developed round hole screens with the following hole sizes: 0.006", 0.009", 0.011", and 0.018".

Manufacturing screens with such small hole sizes has traditionally been difficult. The reason is that in order for the screens to function properly, they needed to be manufactured from very thin metal, thus compromising the strength of the screens.

Quadro has solved this problem by bonding the small hole screen to a larger screen (usually an 0.075" round hole screen) which only provides structural strength.

The new Bonded screens allow Quadro's Comils to effectively mill products to much smaller particle sizes than with non-bonded screens.

AAPS Tradeshow Washington, DC

Quadro recently exhibited at the 2011 AAPS show in Washington, DC which ran from October 24th to the 26th. On display were Quadro's lab scale mills, the Comil U3 and Comil U5. Quadro would like to thank all associates who helped make our exhibit at the show a success. We will see you next year in Chicago.
